# **STEMCELL Technologies**

#### **Experiences from our Demand Driven journey**

December 2 2015 - Juan Abbud, T'ai Palladino

CONFIDENTIAL AND PROPRIETARY Any use of this material without specific permission of StemCell Technologies is strictly prohibited

# **Company Overview**

# Dr. Allen Eaves – Founder, President & CEO

Scientists Helping Scientists<sup>™</sup> | WWW.STEMCELL.COM

#### A Family Owned Company

- We can move quickly in a fast moving market
- We listen to our employees & customers
- Growth over 20 years dependent on sales revenue
   a great discipline!
- Sales are largely dependent on the new products that we develop
- New products are developed by our outstanding R&D scientists - who are essential to STEMCELL's success!
- Planning and prioritization of new product development is done carefully and confidentially
- Leadership & decisions are focused on long-term
  growth and stability

# **STEMCELL** Mission, Vision & Values

#### **Our Mission**

To advance the pursuit of scientific knowledge and understanding by supplying high quality, innovative reagents, tools and services that enable life science research.

#### **Our Vision**

To have our products used in all research labs around the world, significantly impacting the development of new life science discoveries.

#### **Our Values**

Innovation: We are curious and nurture innovation

<u>Quality:</u> When we do something, we do it well

<u>Responsive:</u> We move quickly to support scientific advancements

Integrity: We are truthful and ethical in all our dealings

<u>Collaborative:</u> We work with the scientific community to drive innovation

#### STEMCELL Corporate Video

### The promise of stem cell research

# Keeping up with growth

## Growth demands changes to our processes

Workorder

Changes in scale create challenges for existing processes, transition from

- problem solving to process driven
- Make flow visible Optimize inventory, maintain service level

Create system efficiencies, generate better data & improve metrics

### Operational objective – Improve Plan to Produce

- Improve service levels while maintaining the optimum inventory level establish and maintain optimum inventory, control oscillation
- Establish process efficiencies in the Plan to Produce process by optimizing the use of the ERP and supporting systems
- Develop and establish the required datasets to support the Plan to Produce process and its continuous improvement

# **Evaluating our Planning Processes**

# **Evaluating our Planning Processes**

#### **Production Planning**

Scope: Identify and qualify demand

Output: Firmed workorders in the system

- Materials No movement
- Information Historical sales, sales orders, forecast, manufacturing plan considerations
- Activities Validate forecast, adjust as required, run MRP, review and firm planned orders

#### **Priority Setting**

Scope: Identify and set production priorities

Output: Active workorders prioritized, priorities and release dates entered in the system

- Materials No movement
- Information Inventory position, manufacturing leadtimes, active workorders & demand
- Activities Compile information from a variety of sources, perform analysis, evaluate and assign priority for open orders based on inventory position and demand.

#### **Material Availability Check**

Output: Material availability check performed for active workorders, plan adjusted as needed – date and quantity, expediting plan prepared for shortage review meeting

- Materials No movement
- Information Active workorders, release date, material requirements, inventory position by lot
- Activities Confirm material availability for prioritized workorders

# Why did we choose DDMRP as a solution?

- DDMRP and the R+ software solution simplify the planning, priority setting and material availability check processes
- DDMRP allows us to build robust metrics on the performance of the planning process and its execution
- Strategic inventory planning and metrics combine to support the optimization of inventory
- Ability to manage inventory to a demand driven target

# DDMRP a better fit for our planning goals

#### **System Comparison**

- DDMRP was well aligned with the objectives of our planning processes
- Eliminates manual work to achieve our desired output from the planning process
- The DDMRP model provides simpler and more effective metrics
- System design creates opportunities for process automation

#### **System Comparison**

- Promising inventory level results from snapshot prepared by DDTECH
- Simulation based on historical data run by STEMCELL to validate buffer performance and service levels

## Simulation sample - ADU vs. variability

# Adopting DDMRP

# Implementing DDMRP

- Partnered with Synergy Resources Mike Lilly and Darryl Walker
- ERP consulting to complement process analysis and validate BOM designs
- Selected R+ as our planning software snapshot prepared by DDTECH

## **Implementation team**

# Conceptual design, implementation proposal

- 3 day workshop to develop DDMRP implementation plan Mike Lilly
   & Paddy Ramaiyengar
- Developed and validated initial DDMRP system design
- Selected DDMRP Pilot parts
- Prepared implementation plan identified dependencies for process updates, BOM redesign, training and system rollout
- Kick off!

# Setting the foundation & going live

- Update BOM configurations to support strategic inventory positioning
- Capture complete demand and supply pipeline on ERP system (some information for special cases on other systems)
- Certify Planning and Procurement teams 15 CDDP's
- Go-live Asia Pacific June 2014
- Go-live with select purchased parts August 2014 North America
- Go-live Europe September 2014

# System Design Overview

- Distribution Network & System Architecture
- STEMCELL's Product implications & constraints
- Flow Map
  - Bill of Materials updates
  - Strategic Buffering
- Operating considerations Visible and collaborative execution
- Data Quality and Metrics

# System Design – Distribution Network

### **Distribution Network – 4 ERP Instances**

## **STEMCELL's Planning Considerations**

### STEMCELL's Planning Puzzle – Global, High Mix, Low Volume

#### Sales by product

#### Off the shelf sales

#### Planned Product Introductions 5 years

#### Seasonality and growth

# Deep Bills, Long lead times & growth

#### Cell Separation Cocktail - Bill of Material, LT & CLT

**Changing Demand** 

- 517 day cumulative leadtime, 300 days in prequalified base raw material, difficult to obtain, requires QC qualification - strategic part
- Supports multiple products within a family 239 finished goods
- Growing sales and product lines require buying for growth
- Lot Consistency and Shelf life constraints intermediates and their effect on FG

# Manufacturing constraints - MOQ

- Sample based QC testing significant LT, capacity constraint (i.e. 55 of 56 days)
- Dedicated equipment for some product lines long setup vs run time strategy is to size batches of low volume product to cover long periods and maintain equipment availability – minimum equipment batch size
- Inventory footprint is low
- Manufacturing variability multiple possible uses for certain parts use is test result based
- Shelf life synchronization considerations component lasts longer than parent, lot mixing constraints

## Implementation process

## Implementation process

# System Design – BOM Structure

# Setting Buffer Profiles ADU / MOQ considerations

## Metrics and Analytics – System Inputs Qualifying ADU

# Buffer Levels

## Metrics and Analytics – System inputs, setting part types

Demand Driven Planning

Significant number of parts with irregular consumption patterns are not a natural fit for replenishment buffers.

- Parts with sporadic usage and significant spikes
- Strategic supply, very significant MOQ's
- High mix low volume

# Sporadic usage with significant spikes

ADU X ASRLT X Factor or MOQ

ADU X ASRLT

Greater of:

- Maximum daily consumption rolling 180 days, historical
- Maximum Batch demand (Qty per parent batch), forward looking

Method – RO buffer dynamically calculated by ERP Middleware and loaded into R+

**Usage Location** 

Standard buffer, demand driven replenishment Draw supply from Standing Order Buffer Vendor Location

Min Max Buffer represents Standing Order – i.e. Annual Contract Quantity on Hand always zero Available Stock at Min triggers renewal of standing orders Deliveries triggered by Demand Driven Buffer

Contract amount - Red Zone

Units needed to cover contract

negotiation time + Safety

Method – Buyer sets up vendor location and manages Min Max buffer

# High mix low volume – Retail buffer\*

ADU X LT Round Down to nearest integer MOQ = 0.1ADU X LT Round Up to nearest integer - 0.1

ADU X LT Round Up to nearest integer

This buffer is used to support new product introductions where we have a wide variety and an expectation of low initial demand with no knowledge of which products will grow rapidly.

Buffer mimics Min Max set to 1 and 2 and grows with ADU

\* Thanks to David Poveda for sharing this approach at Demand Driven World 2015

# Supporting the transition

- Compare the new recommendations to the existing system
- Order comparison tools MRP vs. R+ vs. historical inventory levels
- Forecast driven EDU ADU validation for new products
- Simulation make a change and test vs. historical demand
- Use metrics to monitor system performance and trends

# **Monitoring System Performance**

### Metrics and Analytics – Available Stock and QOH

Part on Target

## Metrics and Analytics – Available Stock and QOH

Part needs review - Frequent penetration into Red Zone, increase Red Zone

## Metrics and Analytics – Available Stock and QOH

Part needs review – Available Stock on green or Over, frequent penetration into Red Zone, decreasing ADU

## Measuring & Validating System Inputs

### Leadtime, measure and validate

- Proactively verify leadtime accuracy before initial setting
- Set values to account for variability level
- Ongoing monitoring for changes

# ADU Exception report

- Monitor ADU changes
- Update buffer settings as required
- Adjust horizon
- Use PAF's or ADU override
